

Imagine a big box.

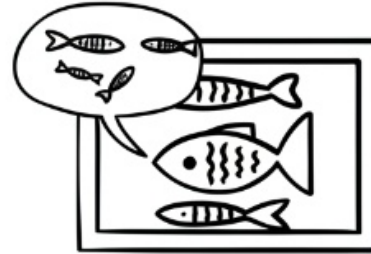

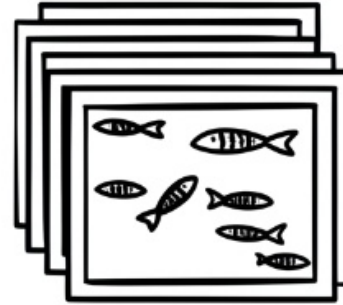

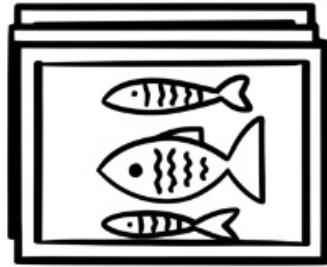

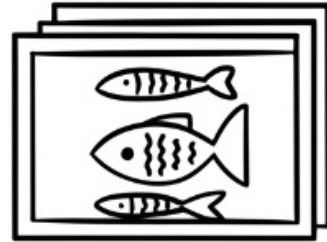

It's full of tiny cats.

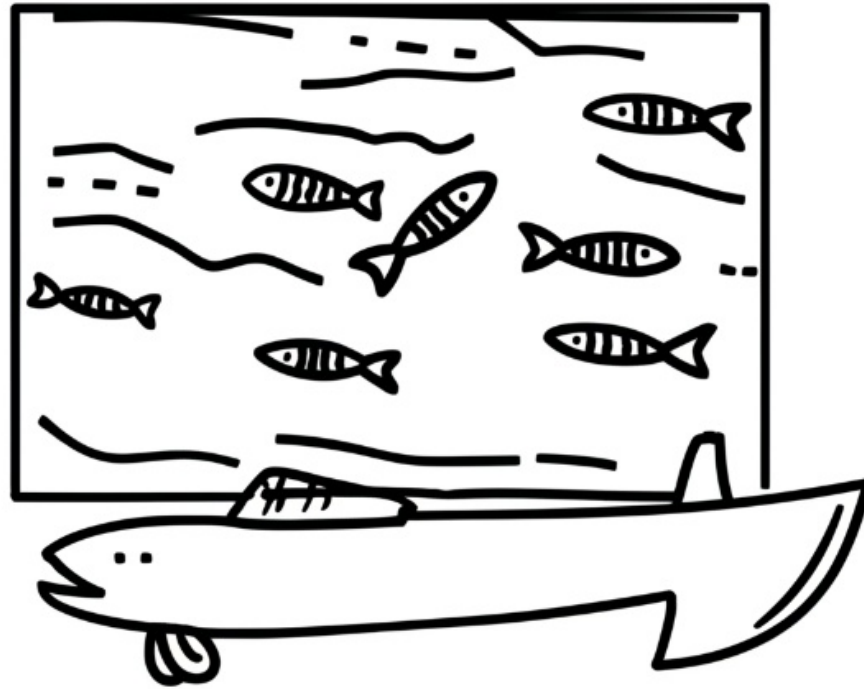

You want to teach
them something.

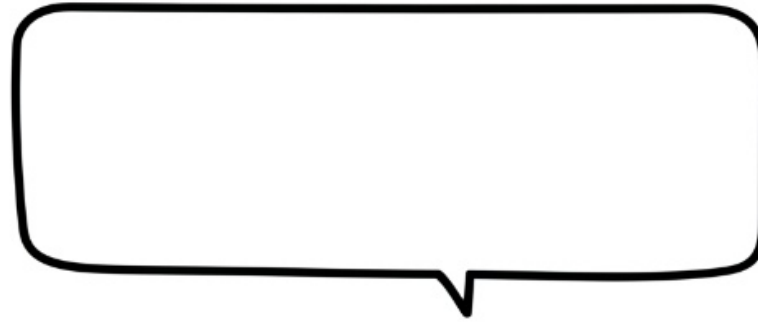

Like how to tell a
picture of a fish.

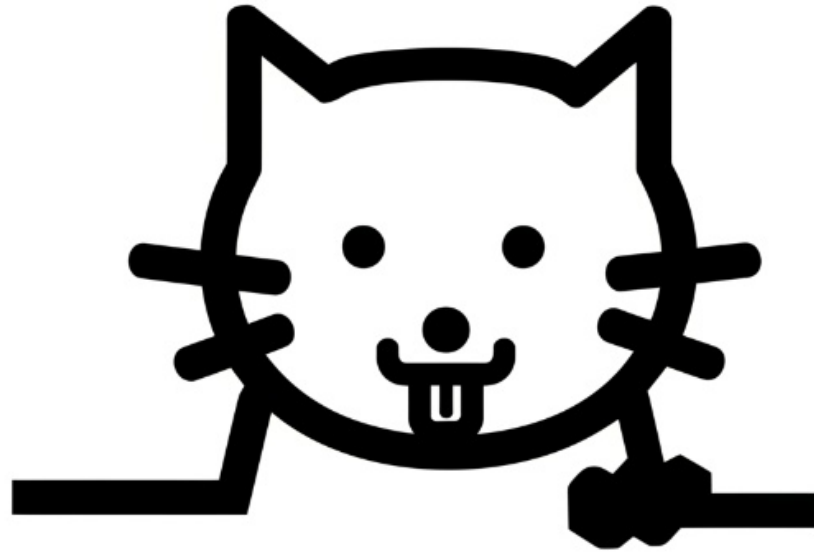

You show them lots of pictures.

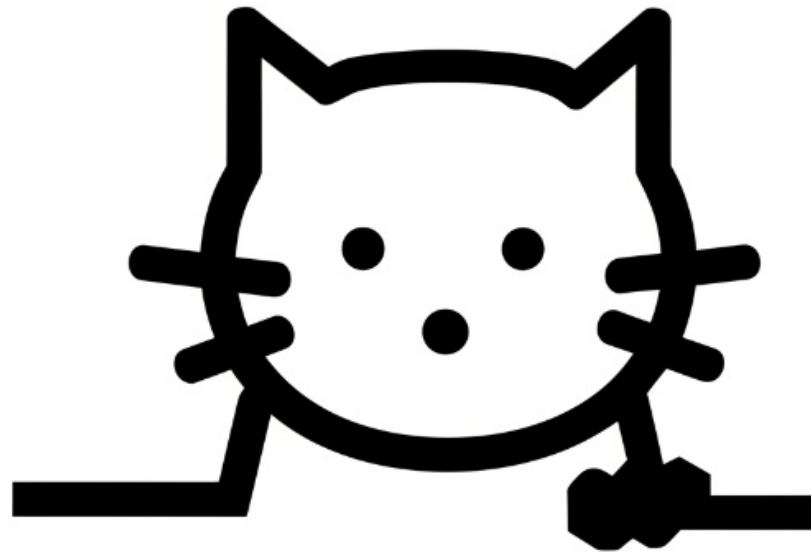

Some are fish. Some are not.

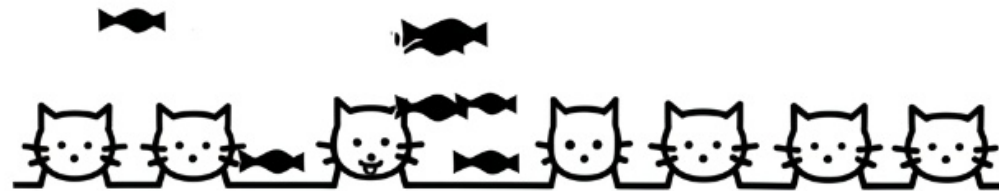

Each tiny cat makes a guess.

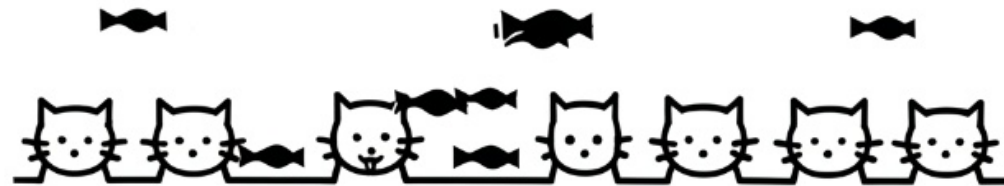

If a cat guesses right,
it gets a tiny treat.

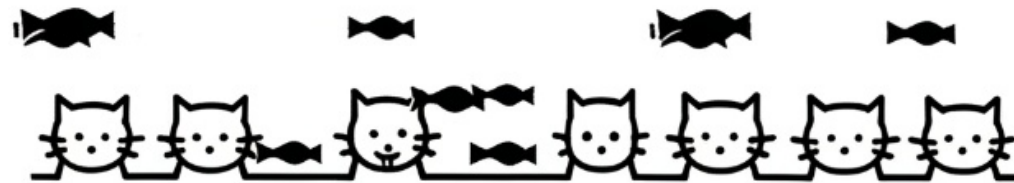

If it's wrong, no treat.

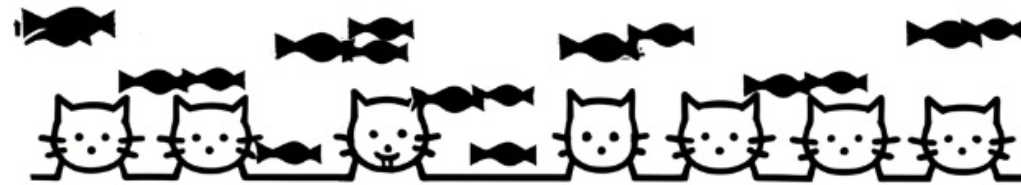

The cats that guessed right get
a little better at spotting fish.

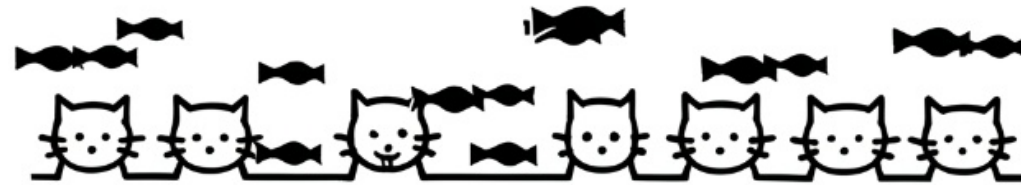

The ones wrong, maybe try
something different next time.

You do this again and again.

The whole group of cats
gets better at knowing fish.

That's kind of how
machine learning works!
